SOCIAL MEDIA ANALYTICS

Engagement, Audience Growth & Content Performance

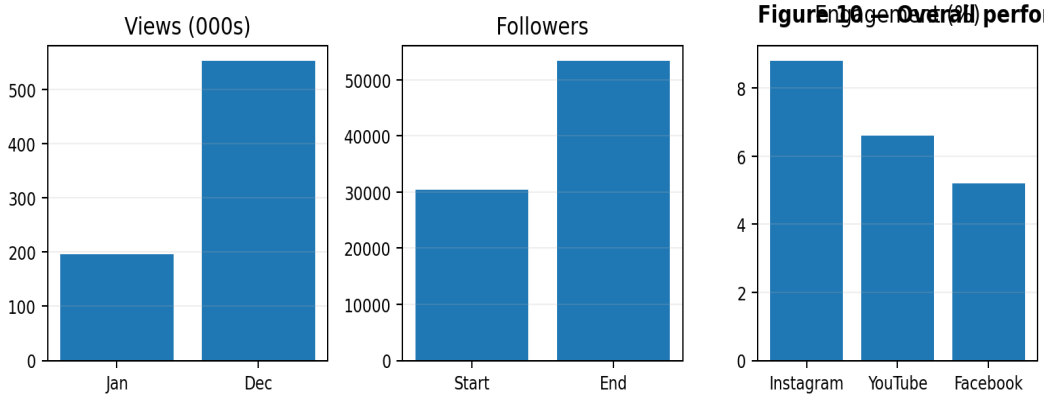

Figure 10 · Overall performance snapshot

VISUAL DATASET REPORT

12-month illustrative snapshot · 3 platforms · 10 charts · Ordered data tables

Prepared October 2026
Descriptive analytics · Simulated dataset

Important: This report uses simulated sample data created for practice. It does not represent actual Instagram, YouTube, or Facebook account performance.

Contents & Methodology

I. Audience growth & platform performance — Figures 1–3
II. Content & engagement — Figures 4–6
III. Audience, timing & relationships — Figures 7–9
IV. Summary dashboard, findings & recommendations — Figure 10
V. Ordered dataset tables and data notes

Purpose of the report

This report demonstrates how social media performance can be reviewed across Instagram, YouTube and Facebook. It focuses on audience growth, content reach/views, interactions, engagement rate, audience profile and posting-time patterns.

Dataset design

The dataset covers a hypothetical 12-month period (January–December). All numeric values were generated as illustrative sample figures so the report can be used for coursework and visualization practice. They must not be presented as real platform results.

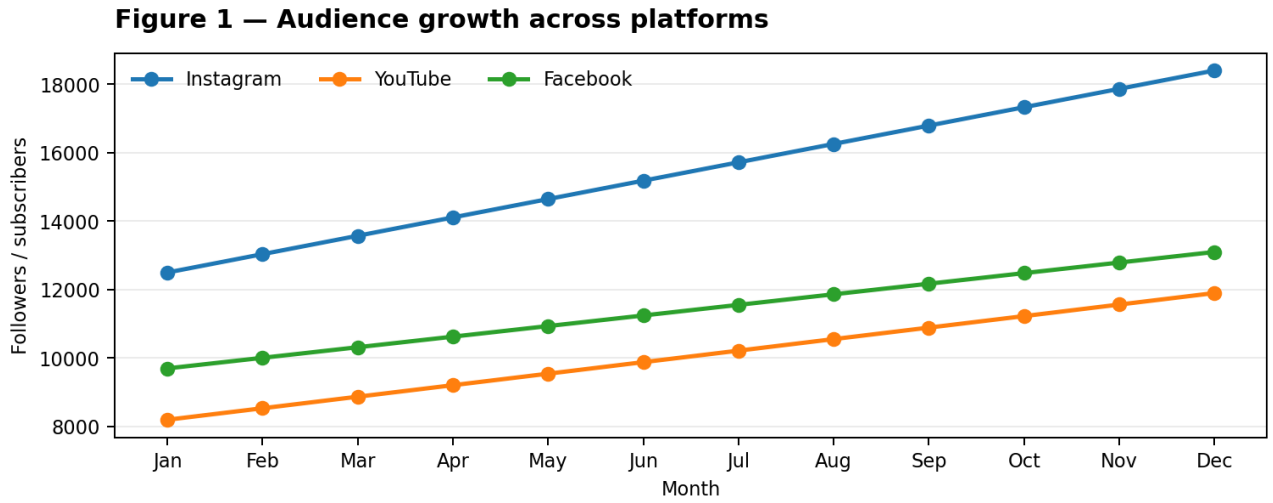

Metric definitions and comparability

Platforms do not always define metrics identically. YouTube Analytics reports views, watch time, unique reach and thumbnail impressions/CTR; Instagram and Facebook provide their own account insights. Therefore, this report uses broad comparison labels and a consistent illustrative sample rather than claiming platform metrics are perfectly interchangeable. See official YouTube Analytics guidance: YouTube Help.

Engagement rate in this report is an illustrative percentage supplied in the sample dataset. In a real report, choose and disclose one formula consistently (for example, interactions divided by reach, or interactions divided by followers), because the result changes with the denominator.

SECTION I · AUDIENCE GROWTH & PLATFORM PERFORMANCE

Figure 1 — Monthly audience growth

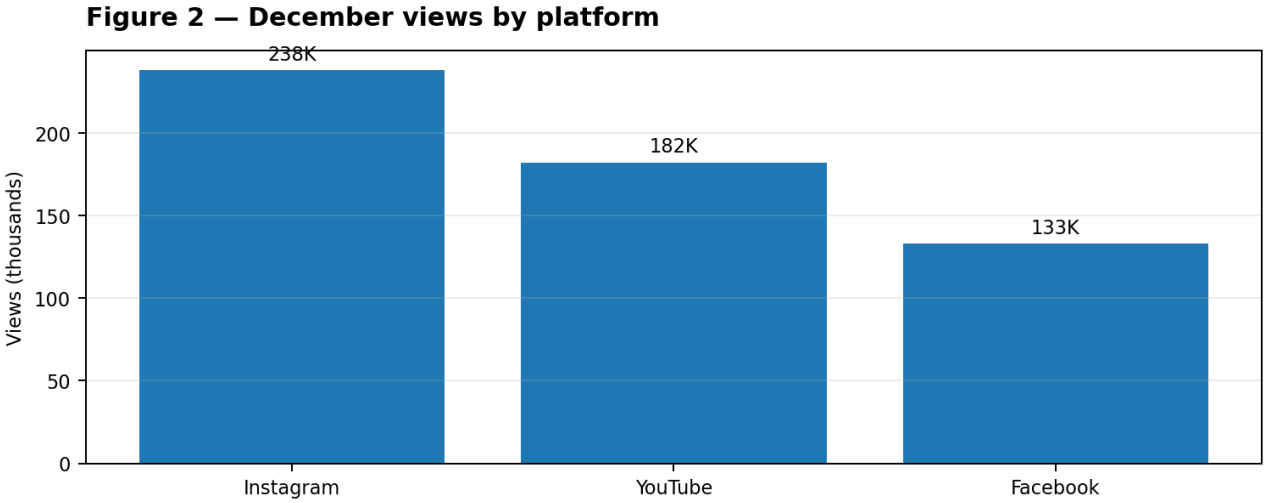

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Platform	January audience	December audience	Net change	Growth (%)
Instagram	12,500	18,400	5,900	47.2%
YouTube	8,200	11,900	3,700	45.1%
Facebook	9,700	13,100	3,400	35.1%

Interpretation: The illustrative series shows a rising audience on all three platforms. Instagram ends with the largest audience in this sample, while all platforms show steady month-to-month growth. Real-world growth is rarely perfectly smooth and should be checked against account exports.

Platform performance comparison

Figure 2 — December views by platform

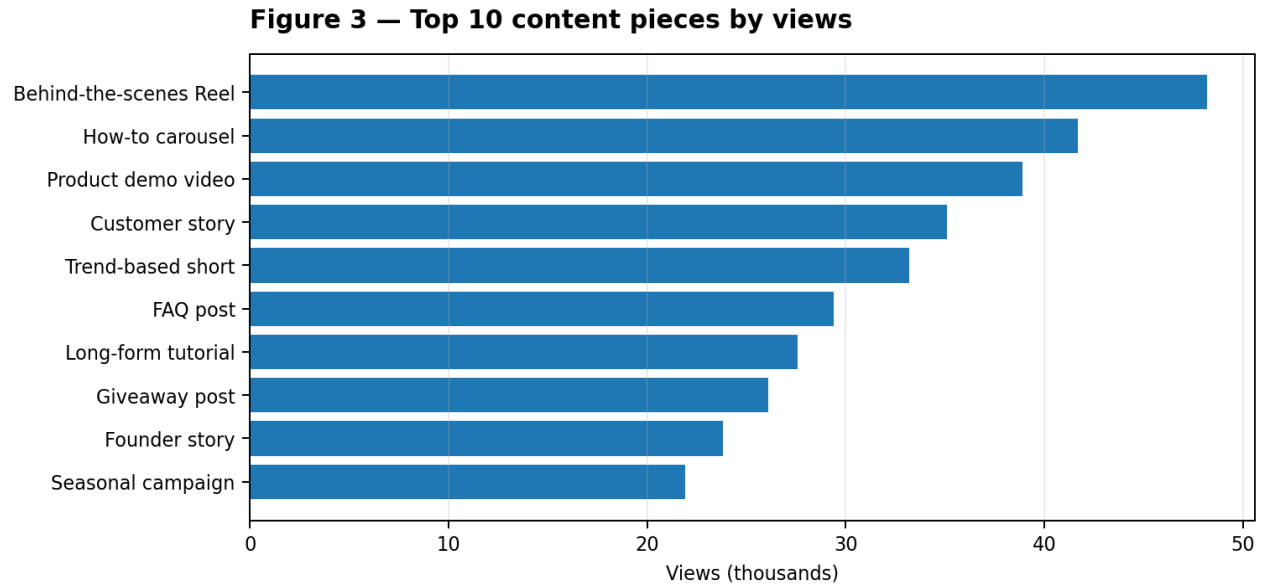

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Platform	December views	Year-end audience	Engagement rate
Instagram	238,000	18,400	8.8%
YouTube	182,000	11,900	6.6%
Facebook	133,000	13,100	5.2%

Interpretation: Instagram leads the sample in December views and engagement rate. This does not prove it is the best platform for every business; the right platform depends on audience, content format, goals and conversions.

Content performance

Figure 3 — Top 10 content pieces by views

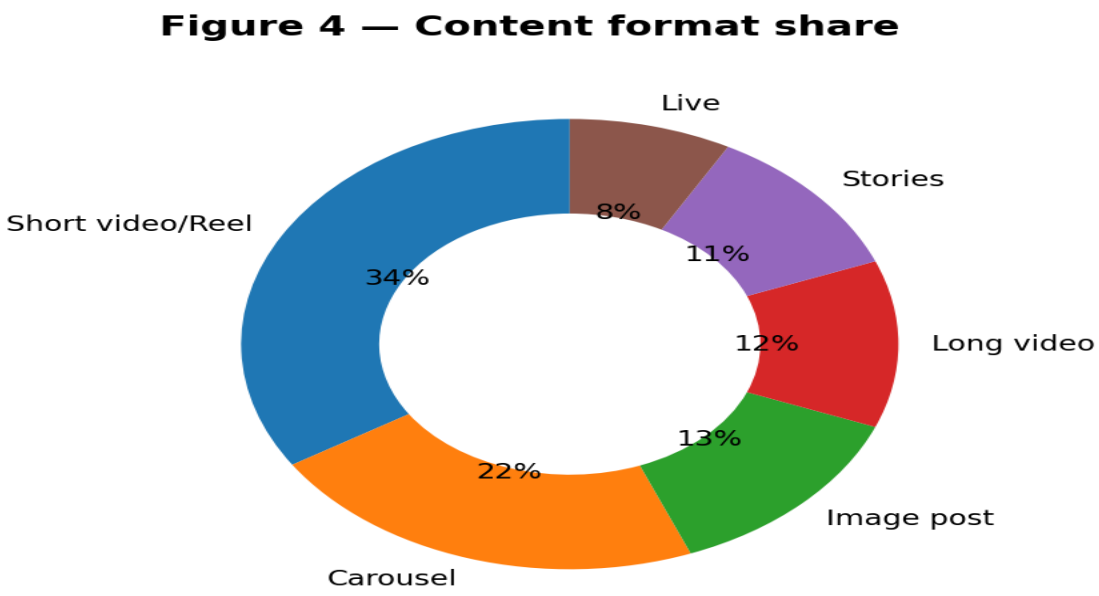

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Rank	Content piece	Views	Interactions	Interaction rate*
1	Behind-the-scenes Reel	48,200	4,820	10.0%
2	How-to carousel	41,700	4,170	10.0%
3	Product demo video	38,900	3,501	9.0%
4	Customer story	35,100	3,861	11.0%
5	Trend-based short	33,200	3,984	12.0%
6	FAQ post	29,400	2,352	8.0%
7	Long-form tutorial	27,600	1,932	7.0%
8	Giveaway post	26,100	3,654	14.0%
9	Founder story	23,800	2,142	9.0%
10	Seasonal campaign	21,900	2,409	11.0%

*Interaction rate here is simulated interactions divided by views. It is a teaching calculation, not a universal platform definition.

SECTION II · CONTENT & ENGAGEMENT

Figure 4 — Content format mix

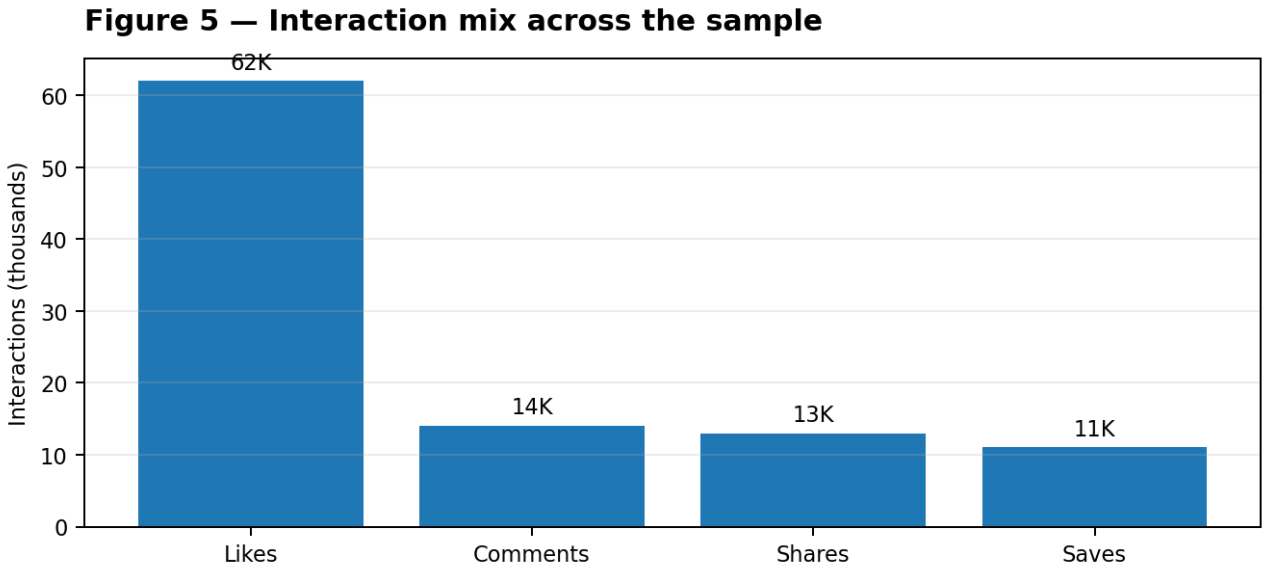

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Rank	Content format	Share of published content
1	Short video / Reel	34%
2	Carousel	22%
3	Image post	13%
4	Long video	12%
5	Stories	11%
6	Live	8%

Interpretation: Short videos and Reels form the largest share of the sample content mix. A content mix should be adjusted based on audience response, production effort and campaign objective—not only on volume.

Interaction analysis

Figure 5 — Interaction mix

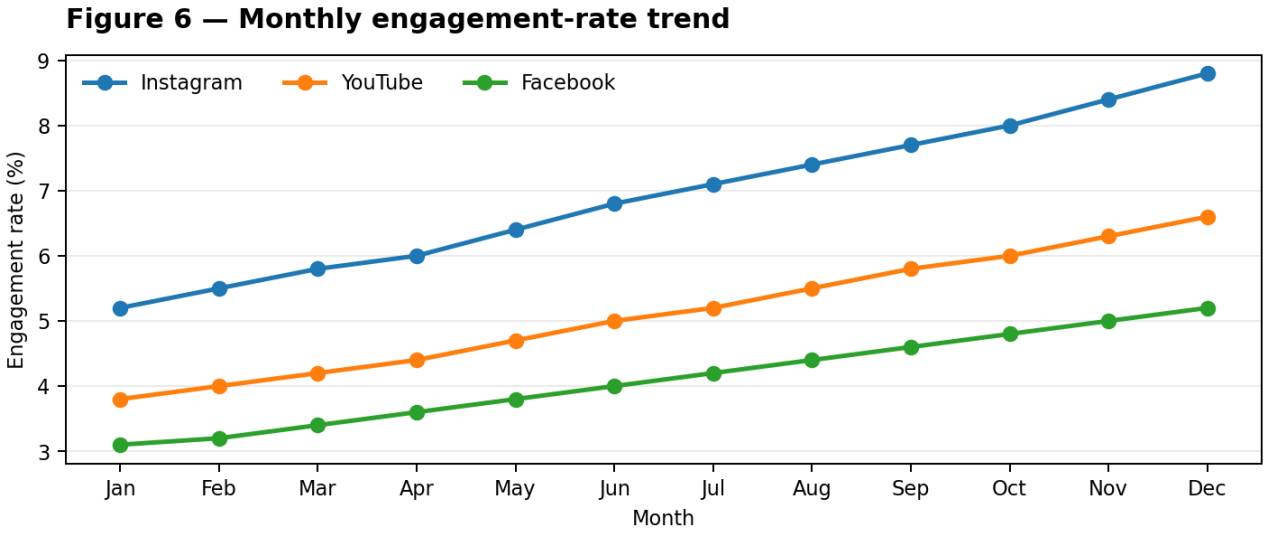

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Interaction type	Total (simulated)	Share of all interactions
Likes	62,000	62%
Comments	14,000	14%
Shares	13,000	13%
Saves	11,000	11%
Total	100,000	100%

Interpretation: Likes account for the largest share, while comments, shares and saves can indicate deeper audience action. The value of each action depends on the objective: awareness, conversation, consideration or conversion.

Engagement trend

Figure 6 — Monthly engagement-rate trend

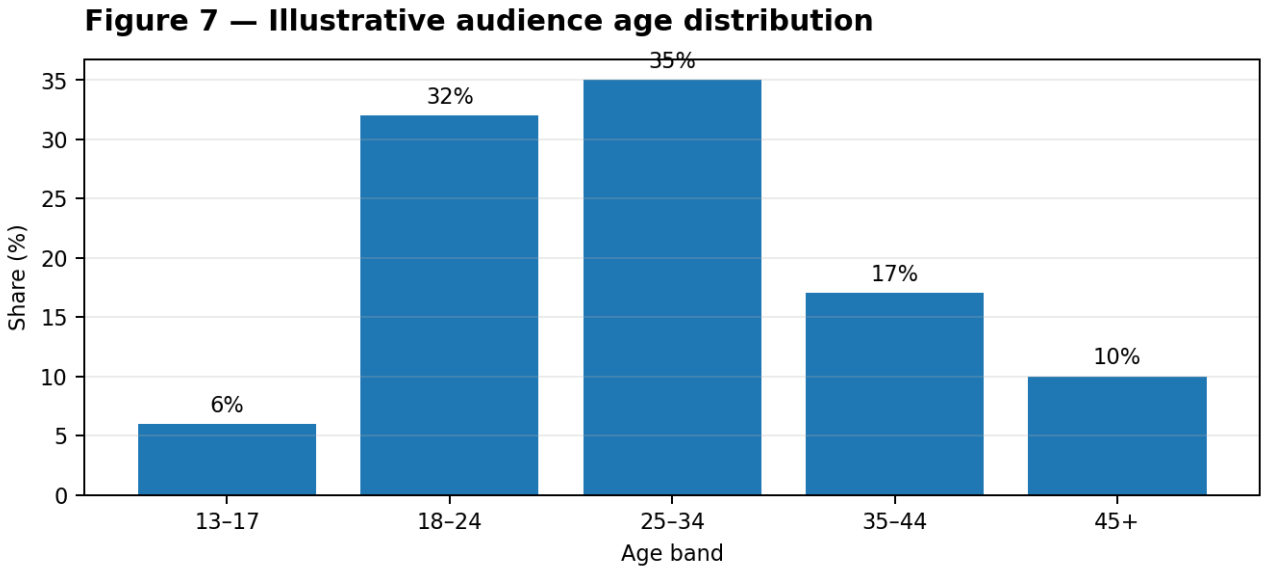

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Platform	January rate	December rate	Change
Instagram	5.2%	8.8%	+3.6 percentage points
YouTube	3.8%	6.6%	+2.8 percentage points
Facebook	3.1%	5.2%	+2.1 percentage points

Interpretation: Engagement rates rise through the illustrative year. For real analytics, define the rate formula and reporting window clearly, and compare like with like (similar formats, audience sizes and paid/organic status).

SECTION III · AUDIENCE, TIMING & RELATIONSHIPS

Figure 7 — Audience age distribution

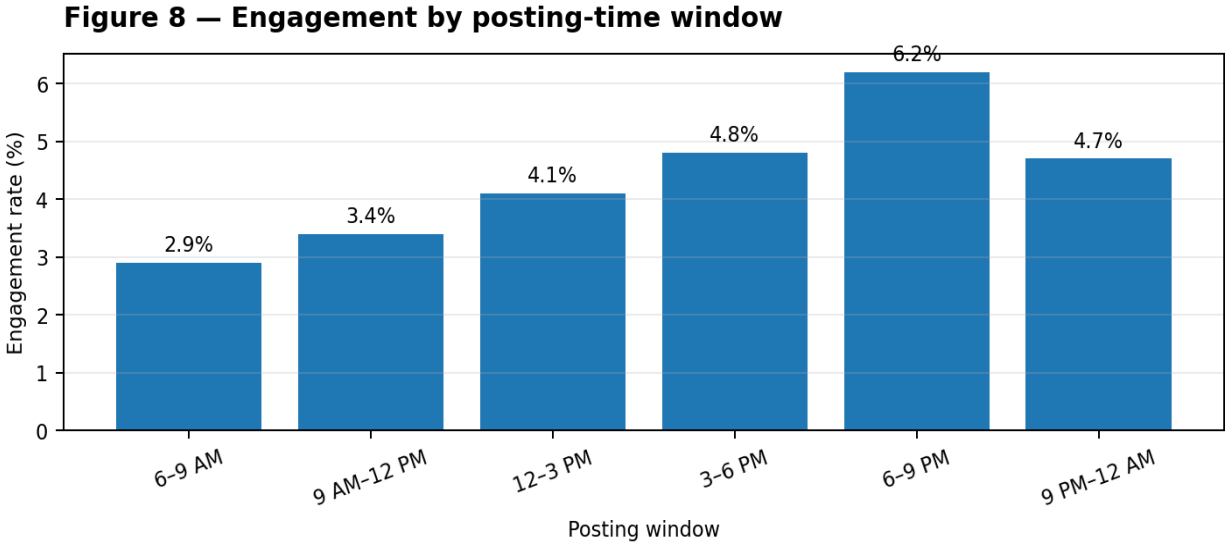

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Rank	Age band	Share
1	25–34	35%
2	18–24	32%
3	35–44	17%
4	45+	10%
5	13–17	6%

Interpretation: The sample audience is concentrated in the 18–34 age bands. This is purely illustrative; use platform-native audience insights before making targeting or content decisions.

Publishing-time analysis

Figure 8 — Engagement by posting-time window

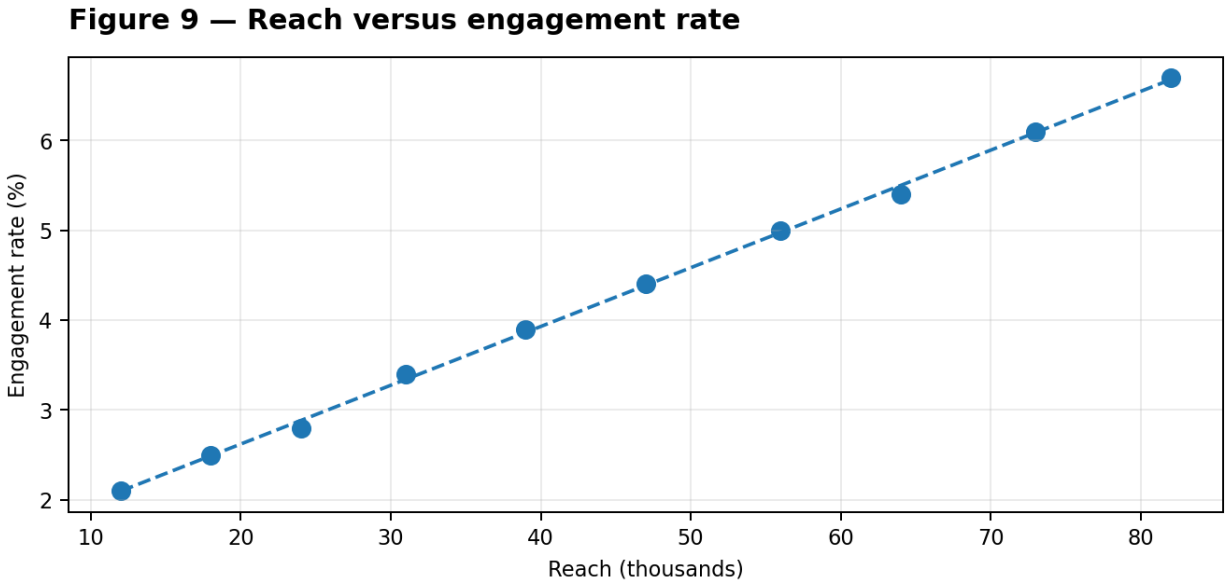

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Rank	Posting window	Engagement rate
1	6–9 PM	6.2%
2	9 PM–12 AM	4.7%
3	3–6 PM	4.8%
4	12–3 PM	4.1%
5	9 AM–12 PM	3.4%
6	6–9 AM	2.9%

Interpretation: In this sample, 6–9 PM performs best. Posting-time findings should be validated with account-specific data and tested over multiple weeks; audience location and routine can change the result.

Reach and engagement relationship

Figure 9 — Reach versus engagement rate

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Sample content item	Reach (000s)	Engagement rate
A	12	2.1%
B	18	2.5%
C	24	2.8%
D	31	3.4%
E	39	3.9%
F	47	4.4%
G	56	5.0%
H	64	5.4%
I	73	6.1%
J	82	6.7%

Interpretation: The simulated points show a positive association between reach and engagement rate. This is not evidence that reach causes engagement; content quality, audience fit and paid promotion may influence both.

SECTION IV · SUMMARY & FINDINGS

Figure 10 — Overall performance snapshot

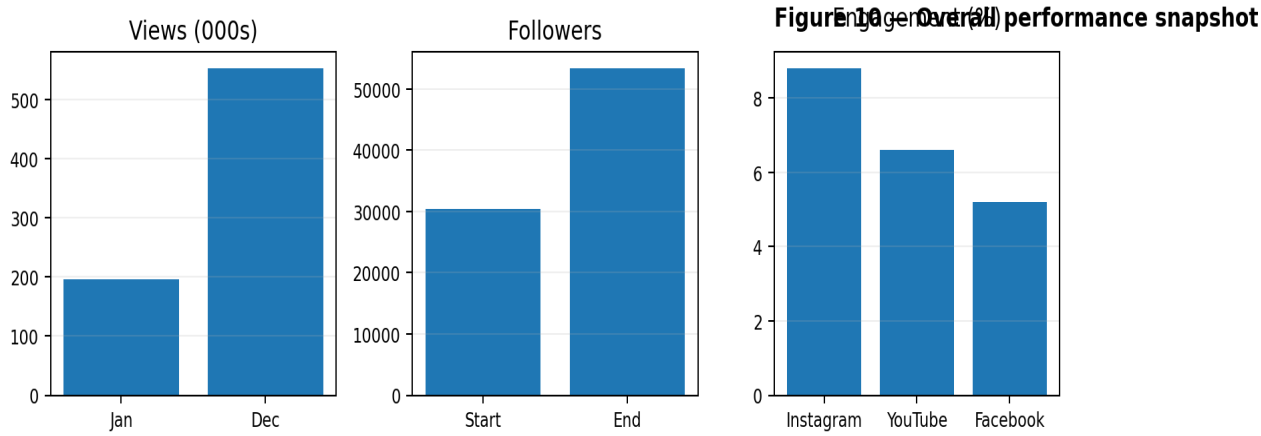

Figure 10 — Overall performance snapshot

Note: values are simulated for educational demonstration; they are not actual platform analytics.

Key metric	Illustrative result
Platforms covered	Instagram, YouTube, Facebook
Year-end combined audience	53,400
Combined December views	553,000
Highest December views	Instagram — 238,000
Highest engagement rate	Instagram — 8.8%
Largest content format	Short video / Reel — 34%
Best posting window in sample	6–9 PM — 6.2%

Key findings

1. All three platforms grow across the sample period.
2. Instagram leads the simulated December views and engagement rate.
3. Short-form video is the largest content format in the sample mix.
4. Likes represent the largest interaction category, but comments, shares and saves remain important signals.
5. The evening posting window performs best in the illustrative timing data.

SECTION V · RECOMMENDATIONS & DATA NOTES

Recommendations

• Set one primary objective per campaign: awareness, engagement, traffic, leads or sales.
• Track platform-native metrics and avoid comparing unlike metrics as if they were identical.
• Test short video, carousel and educational content; review results by format and topic.
• Use a consistent engagement-rate formula and state the denominator in every report.
• Test posting windows over several weeks and base decisions on account insights.
• Add conversion measures (link clicks, enquiries, leads or purchases) when business outcomes matter.

Conclusion

Social media analytics helps turn content activity into measurable learning. The illustrative dataset demonstrates how audience growth, views, interactions, engagement, content mix and timing can be summarized in charts and ordered tables. The sample results are not real-world findings; actual decisions should be based on verified platform exports and clearly defined metrics.

Data accuracy and limitations

All numbers, rankings and trends in this report are simulated for educational use. No live account data was connected, and no platform performance claims are made. Age distribution and posting-time results are hypothetical. Platform metrics and definitions can change over time, so use current official documentation when working with real exports.
